

APEX Indicator Quick Start

Preview guide. APEX is a TradingView indicator built for NQ, ES and crypto traders.

WHAT APEX IS

APEX combines five tools into one clean dashboard: HTF trend filter, entry signals, stop & target levels, confluence score, and risk:reward panel. Built around the philosophy of consistent, smaller gains rather than chasing huge moves.

THE FIVE CORE TOOLS

HTF Trend Filter	See the higher-timeframe trend at a glance. Trade only in its direction to avoid fighting the tape.
Entry Signals	Clear long and short markers plotted directly on the chart. When the signal fires, you know what to do — no interpretation needed.
Stop & Target Levels	Every signal arrives with a defined stop and realistic target. Know your risk before you click.
Confluence Score	Real-time score of how many factors align on a given signal. Higher confluence = higher probability setup.
Risk:Reward Panel	Instant view of the R:R on any potential trade. Take only the ones where the math makes sense; ignore the rest.

HOW TO USE IT (the workflow)

- 1 Check the HTF trend.** Glance at the trend filter. Only consider trades in the trend's direction.
- 2 Wait for an entry signal.** No signal = no trade. Do not anticipate; let the indicator fire.
- 3 Read the confluence score.** Higher is better. Set a minimum threshold (e.g. ≥ 3 out of 5) and skip below it.
- 4 Check the R:R panel.** If the ratio is below 1.5:1, skip. The setup must offer enough room to justify the risk.
- 5 Execute at the marked entry.** Use the stop and target the indicator displays. Do not improvise.
- 6 Walk away once the trade is live.** Stop and target are mechanical. Let them play out without micro-managing.

PRE-LAUNCH NOTE

APEX is in development. Founding-member pricing is locked in for those who join the waitlist before launch. This guide covers what the indicator will do at release.
